

Coach Interview Sheet

For rowing coaches evaluating the offline IMU dashboard. The goal is to understand which metrics are understandable, useful for coaching, or need more context before being used with athletes.

Part A - Coaching perspective

Question 1: Which recurring technical patterns do you most often try to correct?

Question 2: Is it always clear whether one stroke was better than another, or could a tool support this judgement?

Question 3: Would real-time feedback make sense? If yes, how should the athlete receive it, for example vibration on an arm device when one metric changes?

Question 4: Which information is missing during or directly after training?

Question 5: When is variation between strokes normal, and what do you look at before treating it as a problem?

Question 6: If you had to improve an athlete using only one metric, which one would you choose? For example, change of boat speed.

Part B - Dashboard views

For each dashboard view, write whether the meaning is clear and how it could support coaching. Use the notes field for concrete comments, questions, or missing context.

Element	Coach question	Notes / answer
Stroke detection tuning	Is drive-start based tuning understandable enough to use before analysis?	
Time graph	Can you quickly judge whether detected stroke starts and ends look plausible?	
SEAT-only acceleration	Could this help explain drive intensity or unstable seat movement?	
Selected stroke	Could this help discuss one specific stroke with an athlete?	
Stroke overlay	Could comparing strokes support coaching feedback?	
Strongest seat drive speed	Could this timing cue help discuss drive timing or leg work?	
Smoothness	Is the smoothness metric clear enough to use in feedback?	
Change of boat speed	Could this help discuss whether a stroke helped boat movement?	

Part C - Metric usefulness

Tick the boxes and add comments. Stroke timing means when key events happen inside the stroke, especially when peak seat velocity is reached.

Metric	Clear	Useful	Needs context	Comment
Change of boat speed	☐	☐	☐	
Stroke rhythm	☐	☐	☐	
Stroke timing (key events / peak seat velocity)	☐	☐	☐	
Strongest seat drive speed	☐	☐	☐	
SEAT-only peak acceleration	☐	☐	☐	
Smoothness	☐	☐	☐	
Stroke overlay	☐	☐	☐	
Athlete report	☐	☐	☐	

Part D - Select and rank

Which metrics would you consider using, and which would be the most useful?

- ☐ Change of boat speed
 ☐ Stroke rhythm
 ☐ Stroke timing
- ☐ Strongest seat drive speed
 ☐ SEAT-only peak acceleration
 ☐ Smoothness
- ☐ Stroke overlay
 ☐ Athlete report
 ☐ Other metric

Other metric:

Rank the most useful metrics

Rank	Metric	Reason
1		
2		
3		
4		
5		

Part E - Final feedback

Question 1: Which dashboard view should be simplified most?

Question 2: Which missing metric would make the dashboard more useful?

Question 3: Should feedback be live, post-session, or both?

Question 4: Should the system start claiming things like weak leg drive if peak velocity is reached too late? Is the system functioning well enough for such a claim to make sense?
